

# PRODUCTION FOR IMPROVED NUTRITION

## ▶ Collaborate. Learn . Adapt

The USAID UGANDA Production for Improved Nutrition project is built on a public-private partnership working to reduce malnutrition in Uganda. Our interventions are in alignment with national strategies to improve nutrition especially for the most vulnerable. Along the way we are learning from our experience leveraging resources and expertise with other players, problem solving and adapting the design of interventions to maximize and sustain impact.

### Building strong networks for effective implementation

Leveraging resources for more effective interventions makes sense. It is cost effective and ensures that all available and relevant resources can be maximized to more holistically meet critical needs of communities.

Nutrition and its effective management is cross cutting and diverse. It requires:

- Collaboration with key actors to effectively leverage resources and reach communities with diverse services.
- Learn from different experiences and best practices and use them to improve interventions and service delivery

Working in alignment with national strategies, we collaborate with line ministries, agencies, departments and local governments to ensure that our interventions in their constituencies are relevant, effective and sustainable.

Through regular performance assessment, experience sharing workshops with project stakeholders and beneficiaries, districts and partner fora, we are learning regularly from those that we serve and work with how to improve our operations.

### Private Public Partnerships for sustainability

We work with line ministries to align the project focus and strategy to the national agenda. This involves leveraging the technical, policy and resource baskets to improve quality service delivery and adopt sustainable approaches.

NUTRISET as a key food production and quality control partner has provided both technical and technological assistance required to produce RUTF that meet both national and international standards.

University Research Co., LLC (URC) has supported the food security and livelihoods component of the project and also provided additional project management and administration and technical assistance to RECO Industries.

Through our partnership with district leaders, nutrition focal persons, health facilities, and farmers we are able to carry the message of nutrition to diverse audiences.
